GPC's 3D Freight Measure provides instant measurements with a 3D camera to calculate the volume, width, length and depth so you can accurately measure your cargo, warehousing or postal items.

## What are the common problems with freight and logistic measurement?

- Lack of accuracy
- Clients providing false information about the incoming package making it difficult to forward plan and pack efficiently
- Manual measurements takes a lot of time from a single engineers role

## How do GPC solve your freight and logistic measurement problems?

Our software provides you instant measurements of an item so you are effectively able to create a plan of action for forward processing, cross charging or stock control. It provides multiple customizable functions including manual measuring, birds eye view measuring. We create functionality based on clients' needs so the software is individual and unique to your requirements.

Using advanced 3D algorithms the camera can identify the size of any object. We have partnered with the largest freight and passenger airline in the UK to prove we can accurately measure the volume occupied by any shape of freight. This enables the carrier to much for efficiently load freight and has improved their freight productivity by more than 40%. We are currently working with the carrier's customers to implement our solution so the airline is forewarned of the exact size of the freight.
